-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

#### Status

- 1) Responsive to communication(s) filed on 23 December 2005.
- 2a) This action is FINAL.                    2b) This action is non-final.
- 3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

#### Disposition of Claims

- 4) Claim(s) 1-6,8-20 and 22-30 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) Claim(s) \_\_\_\_\_ is/are allowed.
- 6) Claim(s) 1-6,8-20 and 22-30 is/are rejected.
- 7) Claim(s) \_\_\_\_\_ is/are objected to.
- 8) Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

#### Application Papers

- 9) The specification is objected to by the Examiner.
- 10) The drawing(s) filed on \_\_\_\_\_ is/are: a) accepted or b) objected to by the Examiner.  
 Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
 Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

#### Priority under 35 U.S.C. § 119

- 12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) All    b) Some \* c) None of:
  1. Certified copies of the priority documents have been received.
  2. Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

#### Attachment(s)

- 1) Notice of References Cited (PTO-892)
- 2) Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)  
 Paper No(s)/Mail Date 9/28/05.
- 4) Interview Summary (PTO-413)  
 Paper No(s)/Mail Date. \_\_\_\_\_.
- 5) Notice of Informal Patent Application (PTO-152)
- 6) Other: \_\_\_\_\_.

Art Unit: 2153

## DETAILED ACTION

This action is in response to an Amendment filed December 23, 2005. Claims 1-6,8-20, and 22-30 are presented for further consideration.

### ***Response to Arguments***

Applicant's arguments, see Remarks/103 Rejection of the Claims, with respect to claims 1-6,8-20, and 22-30 have been fully considered but are not persuasive.

In considering the Applicant's arguments the following factual remarks are noted:

- (I) Applicant contends that Miyajima does not cure the deficiency if Hawthorne and Tian to teach or suggest a router that includes a verification module to semantically validate image data and patient data of a network communication and a reconciliation manager that displays a user interface for reconciling any image data and patient data that is invalid.

In considering (I), Applicant contends that Miyajima does not cure the deficiency if Hawthorne and Tian to teach or suggest a router that includes a verification module to semantically validate image data and patient data of a network communication and a reconciliation manager that displays a user interface for reconciling any image data and patient data that is invalid. Examiner respectfully disagrees. As addressed the previous Office Action, Hawthorne expressly discloses a router employed to facilitate data transmission of medical imagery (Hawthorne; abstract). In addition, Tian discloses semantically validating medical image assets, and providing a user interface to

Art Unit: 2153

reconcile invalid data (i.e. protocol compatibility) prior to transmission (Tian; abstract). Therefore, these aforementioned limitations (i.e. router; verification module; and reconciliation manager) of Applicant's invention were well known in the art at the time of the invention. Examiner asserts that Miyajima is cited, so as to further evidence the obviousness of configuring the reconciliation manager for correcting/and or validating the actual information contained within the network communication (i.e. medical imagery and associated patient data), so as to reduce erroneous inputs for the router's intended field of use, as disclosed by Applicant (i.e. medical environment), (Miyajima; constitution). Examiner asserts that validating the image data itself (i.e. reconciling any image data and patient data) is similarly an obvious modification within the scope of Miyajima (i.e. correcting data so patient data is associated with appropriate imagery data; Purpose), and is therefore is not a patentable distinction of instant invention over the cited prior art, as suggested by Applicant (Remarks, page 9). In addition, Miyjima expressly discloses taking action to validate and/or reconcile the fact that the image is missing, through re-entry of patient information (i.e. the patient's name; the distinction of sex; date of birth or patient ID number; constitution). Therefore, Examiner maintains the rejection of claims as set forth below in the Office Action.

### ***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and

Art Unit: 2153

the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

**Claims 1,9-10, and 12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pinsky et al. (US Patent 5,655,084), in view of Miyajima (JP Patent 406209907) and Tian et al. (US Patent 5,671,353), and further in view of Yang et al. (US Patent 5,465,331) hereinafter referred to as Pinsky, Miyajima, Tian, and Yang respectively.**

In reference to claim 1, Pinsky discloses a method for distributing medical images and other associated data across a wide area network. Specifically, the method comprises steps for routing the aforementioned medical information to the appropriate resources (column 1, lines 44-60). Pinsky further discloses the medical image routing method to compare the steps of: receiving a network communication (i.e. packet) including an asset (i.e. study) having image data (i.e. digital image) and patient data (i.e. associated study information), (column 2, line 65 to column 3, line 23; column 3, lines 58-67; column 6, lines 48-67; and Figure 1); storing the asset, (column 3, line 57 to column 4, line 7); and forwarding the storage asset, (column 4, lines 7-33). However, Pinsky fails to disclose validating the patient data, wherein validating the patient data includes issuing a reconciliation event when the patient data is invalid or incomplete; requesting the invalid or incomplete patient data to be reconciled during the reconciliation event. Nonetheless, this would have been an obvious modification to the aforementioned method to one of ordinary skill in the art at the time of the invention, as further evidenced by Miyajima.

Art Unit: 2153

In an analogous art, Miyajima discloses a method for employing an image diagnosis device for correlating and storing medical images related to a patient (purpose; constitution). Miyajima further discloses the method comprises validating patient data (i.e. patient's name, the distinction of sex, the date of birth) associated with the image data (i.e. medical image), wherein validating the patient data includes issuing a reconciliation event when the patient data is invalid or incomplete, and requesting the invalid or incomplete patient data to be reconciled (i.e. via user interface) during a reconciliation event (i.e. changing input of patient's ID number), (constitution). One of ordinary skill in the art would have been so motivated to accordingly modify the aforementioned method, so as to significantly reduce faulty inputs and thereby increasing accuracy of network communication, (Miyajima purpose). However, the references fail to explicitly disclose forwarding the storage asset upon reconciling the patient data. Nonetheless, this would have been an obvious modification to the aforementioned method, for one of ordinary skill in the art at the time of invention, as further evidenced by Tian.

In another analogous art, Tian discloses a method for validating the non-pixel data of medical image assets (i.e. DICOM messages), in order to "facilitate the transmission on digitized medical imagery ", (column 1, lines 43-67 and column2, lines 40-60). Tian further discloses that the method entails validating data (column 5, lines 10-21; column 10, lines 22-29); and forwarding the asset upon reconciling the non-pixel (i.e. patient) data, (column 5, lines 13-21). One of ordinary skill in the art would have been motivated to incorporate the aforementioned limitations into the medical image

Art Unit: 2153

routing method as disclosed by Pinsky and Miyajima, so as to validate messages prior to routing them to an appropriate destination, thereby improving reliability of transmitted digitized imagery (Tian column 1, lines 25-40). The references fail to explicitly disclose storing and validating the patient data in parallel. Nonetheless, concurrently storing and processing network communications (i.e. packets) was well known in the art at the time of the invention, as further evidenced by Yang. Therefore the limitation would have been an obvious modification to the aforementioned method to a person of ordinary skill in the art.

In another analogous art, Yang discloses a routing method involving storing and processing a network communication in parallel to subsequently forward the information throughout different networks, (column 1, lines 48-63 and column 2, lines 51-62). One of ordinary skill in the art would have been so motivated to implement this modification to the medical image routing method in order to concurrently execute command and data trafficking routing tasks thereby improving system efficiency, (Yang column 1, lines 9-13).

In reference to claim 12, Pinsky further discloses the aforementioned medical image method to comprise the steps of: receiving a number of packets with multiple software modules listening to a single communication socket of a TCP/IP based network, wherein the packets contain a storage asset (i.e. study) having image data (i.e. digital image) and patient data (i.e. associated study information), (column 2, line 65 to column 3, line 23; column 3, lines 58-67 column 6, lines 59-67; column 7, lines 35-

Art Unit: 2153

49;column 8, lines 51-54; column 9, lines 15-20; column 11, lines 31-36); selectively processing the patient data and the image data with software modules to store the asset as the packets are received, (column 3, line 57 to column 4, line 7; column 59-67; and column 12, lines 12-35); and forwarding the storage asset to a network destination prior to receiving all of the image-data, (column 4, lines 7-33; column 7, lines 1-56; and column 6, lines 59-67). However, Pinsky does not show a separate software module for validating the patient data; issuing a reconciliation event when the patient data is invalid or incomplete; requesting the invalid or incomplete patient data to reconcile the patient data. Nonetheless, this would have been an obvious modification to the aforementioned method to one of ordinary skill in the art at the time of the invention, as further evidenced by Miyajima.

In an analogous art, Miyajima discloses a method for employing an image diagnosis device for correlating and storing medical images related to a patient (purpose; constitution). Miyajima further discloses the method comprises validating patient data (i.e. patient's name, the distinction of sex, the date of birth) associated with the image data (i.e. medical image), wherein validating the patient data includes issuing a reconciliation event when the patient data is invalid or incomplete, and requesting the invalid or incomplete patient data to be reconciled (i.e. via user interface) during a reconciliation event (i.e. changing input of patient's ID number), (constitution). One of ordinary skill in the art would have been so motivated to accordingly modify the aforementioned method, so as to significantly reduce faulty inputs and thereby increasing accuracy of network communication, (Miyajima purpose). However, the

Art Unit: 2153

references fail to explicitly disclose forwarding the storage asset upon reconciling the patient data and prior to receiving all of the image data. Nonetheless, this would have been an obvious modification to the aforementioned method, for one of ordinary skill in the art at the time of invention, as further evidenced by Tian.

In an analogous art, Tian discloses a method for validating the non-pixel (i.e. patient) data of medical image assets (i.e. DICOM messages) with a software module, in order to "facilitate the transmission on digitized medical imagery ", (column 1, lines 43-67 and column 2, lines 40-60). Tian further discloses that the method entails validating the patient data and forwarding the asset upon validating the patient data prior to receiving all of the image data, (column 5, lines 13-21) One of ordinary skill in the art would have been motivated to incorporate the aforementioned limitations into the medical image routing method as disclosed by Pinsky, so as to validate messages prior to routing them to an appropriate destination, thereby improving reliability of transmitted digitized imagery (Tian column 1, lines 25-40). The references fail to explicitly disclose storing and validating the patient data in parallel. Nonetheless, concurrently storing and processing network communications (i.e. packets) was well known in the art at the time of the invention, as further evidenced by Yang. Therefore the limitation would have been an obvious modification to the aforementioned method to a person of ordinary skill in the art.

In another analogous art, Yang discloses a routing method involving storing and processing a network communication in parallel to subsequently forward the information throughout different networks, (column 1, lines 48-63 and column 2, lines 51-62). One of

Art Unit: 2153

ordinary skill in the art would have been so motivated to implement this modification to the medical image routing method in order to concurrently execute command and data trafficking routing tasks thereby improving system efficiency, (Yang column 1, lines 9-13).

In reference to claim 9, Pinsky and Tian show the medical image routing method wherein forwarding the network communication upon validating the asset comprises initiating an outbound network communication prior to receiving all of the image data (Pinsky column 6, lines 59-65 and Tian column 5, lines 16-21).

In reference to claim 10, Pinsky and Tian, show the medical image routing method wherein receiving a number of packets from a network, and where storing the image data and validating the patient data commences after receiving a first portion of the packets, (Pinsky column 3, line 57 to column 4, line 7; column 6, lines 59-65; and Tian column 5, lines 16-21 and column 10, lines 21-29).

**Claim 16 is rejected under 35 U.S.C. 103(a) as being unpatentable over Haworth et al. (US Patent 6,661,228), in view of Flaig et al. (US Patent 5,105,424), further in view of Miyajima (JP Patent 406209907), Tian et al. (US Patent 5,671,353), and further in view of Yang et al. (US Patent 5,465,331) hereinafter referred to as Haworth, Flaig, Miyajima, Tian, and Yang respectively.**

Art Unit: 2153

In reference to claim 16, Haworth discloses a medical imaging system that employs integrated routers in order to facilitate data transmission within the multi-server system, (column 1, lines 50-66; column 3, lines 22-28; and Figure 4). Haworth explicitly discloses the router to comprise: a computer-readable medium (i.e. storage device) storing routing information (i.e. registration table), (column 2, lines 21-35; column 20, lines 40-55; column 11, lines 1-25; and Figure 6); and a storage manager software module (i.e. data store software) that receives a network communication including an asset having image data (i.e. medical image) and patient data (i.e. associated patient information), and stores the asset to a storage device, (column 2, lines 52-61; column 4, lines 7-20; column 5, lines 51-64; and column 10, lines 56-67); and a routing module (i.e. router software) that forwards the storage asset to a network destination in accordance with the routing information, (column 10, lines 40-55 and column 11, lines 4-25). However, Haworth does not disclose expressly that the routing information maps destinations to routes within a network. Nonetheless, mapping destinations to routes was well known in the art the time of the invention, as further evidenced by Flaig. Therefore, this limitation would have been an obvious modification to the aforementioned router to one of ordinary skill in the art at the time of the invention.

In an analogous art, Flaig discloses a router that retrieves the route to a specified destination from a map, and subsequently transmits the network communication (i.e. packet) to adjacent nodes according to the determined route, (abstract and column 5, lines 9-20). One of ordinary skill in the art would have been motivated to implement this

modification into the aforementioned router as disclosed by Haworth, in order to allow the processor in the router to "provide good performance with a minimum of silicon area on the chip consumed thereby", (Flag column 4, lines 14-19). However, the references fail to disclose a validation software module that validates the patient data, and forwards the storage asset upon the validation of the patient data. Nonetheless, these limitations would have been obvious modifications to the aforementioned router for one of ordinary skill in the art at the time of the invention, as evidenced by Miyajima.

In an analogous art, Miyajima discloses an image diagnosis device for correlating and storing medical images related to a patient (purpose; constitution). Miyajima further discloses device comprises means for validating patient data (i.e. patient's name, the distinction of sex, the date of birth) associated with the image data (i.e. medical image), wherein the image diagnosis device issues a reconciliation event when the patient data is invalid or incomplete, and requesting the invalid or incomplete patient data to be reconciled (i.e. via user interface) during a reconciliation event (i.e. changing input of patient's ID number), (constitution). One of ordinary skill in the art would have been so motivated to accordingly modify the aforementioned router, so as to significantly reduce faulty inputs and thereby increasing accuracy of network communication, (Miyajima purpose). However, the references fail to explicitly disclose the routing module forwarding the storage asset upon validation of the patient data. Nonetheless, this would have been an obvious modification to the aforementioned method, for one of ordinary skill in the art at the time of invention, as further evidenced by Tian.

In an analogous art, Tian discloses a method for validating the non-pixel (i.e. patient) data of medical image assets (i.e. DICOM messages) with a software module, in order to "facilitate the transmission on digitized medical imagery ", (column 1, lines 43-67 and column 2, lines 40-60). Tian further discloses that the method entails validating the patient data and forwarding the asset upon validating the patient data, (column 5, lines 13-21). One of ordinary skill in the art would have been motivated to incorporate the aforementioned limitations into the medical image router, so as to validate messages prior to routing them to an appropriate destination, thereby improving reliability of transmitted digitized imagery (Tian column 1, lines 25-40). The references fail to explicitly disclose storing and validating the patient data in parallel. Nonetheless, concurrently storing and processing network communications (i.e. packets) was well known in the art at the time of the invention, as further evidenced by Yang. Therefore the limitation would have been an obvious modification to the aforementioned method to a person of ordinary skill in the art.

In another analogous art, Yang discloses a routing apparatus that stores and processes a network communication in parallel to subsequently forward the information throughout different networks, (column 1, lines 48-63 and column 2, lines 51-62). One of ordinary skill in the art would have been so motivated to implement this modification to the router as disclosed by Haworth, in order to concurrently execute command and data trafficking routing tasks thereby improving system efficiency, (Yang column 1, lines 9-13).

**Claims 23 and 25 are rejected under 35 U.S.C. 103(a) as being unpatentable over Schnellinger et al. (US Patent 5,642,513), in view of Fendick et al. (US Patent 6,252,857), and further in view of Miyajima (JP Patent 406209907), hereinafter referred to as Schnellinger, Fendick, and Miyajima respectively.**

In reference to claim 23, Schnellinger discloses an method that supports automated routing of digital medical imagery to a plurality of destinations throughout a network, (column 1,lines 54-60;column 3,lines 9-20; and Figure 3). Schnellinger explicitly discloses the Autorouter method to comprise: storing routing information (i.e. Multiple AutoRouting Rule) mapping destinations to routes within a network, (column 3, lines 25-45 and column 5, line 63 to column 6, line 10); receiving a network communication comprising destination information (i.e. ACR-NEMA image message header) and a storage asset (i.e. digitized medical image), (column 3, line 67 to column 4, line 13;column 4, line 40-46; and column 4, lines 59-63); storing a plurality of outbound network communications in a plurality of queues, wherein the outbound network communications include references (i.e. image transmission request) to the storage asset; and selecting a plurality of routes from routing information and forwarding the network communications according to the selected routes, (column 9, lines 8-39; column 6, lines 1-10; and Figure 3-items 14A-15A). Although Schnellinger discloses substantial features to the claimed invention, the reference fails to explicitly disclose the forwarding the network communications to selected routes in parallel. Nonetheless, this

Art Unit: 2153

modification to the Autorouter method would have been obvious to one of ordinary skill in the art at the time of the invention, as further evidenced by Fendick.

In an analogous art, Fendick discloses a method for simultaneous transmission of information to multiple destinations or "multicasting", (column 2, lines 50-56 and Figure 2). One of ordinary skill in the art would have been motivated to implement this modification into the Autorouter method in order to support the concurrent transmission of medical data to a plurality of destinations (e.g. hospital areas, off-site facilities), thereby increasing system flexibility and ease of use, (Schnellinger column 5, lines 30-48). The method disclosed by Schnellinger and Fendick fail to show validating the image data and patient data of the storage asset. Nonetheless, these limitations would have been obvious modifications to the aforementioned method for one of ordinary skill in the art at the time of the invention, as evidenced by Miyajima.

In an analogous art, Miyajima discloses method for employing an image diagnosis device for correlating and storing medical images related to a patient (purpose; constitution). Miyajima further discloses the method comprises means for validating patient data (i.e. patient's name, the distinction of sex, the date of birth) and the image data (i.e. medical image), wherein the image diagnosis device issues a reconciliation event when the patient data is invalid or incomplete, and requesting the invalid or incomplete patient data to be reconciled (i.e. via user interface) during a reconciliation event (i.e. changing input of patient's ID number), (constitution). One of ordinary skill in the art would have been so motivated to accordingly modify the

Art Unit: 2153

aforementioned router, so as to significantly reduce faulty inputs and thereby increasing accuracy of network communication, (Miyajima purpose).

In reference to claim 25, Schnellinger shows the Autorouter method to further comprise: storing a set of rules (Multiple Autorouting Rule), (Schnellinger column 3, lines 25-45); and comparing at least a portion of the data to the set of routing rules, (Schnellinger column 5, line 63 to column 6, line 10); and selecting a plurality of routes from the routing information based on the destination information and a result of the comparison, (Schnellinger column 3, line 67 to column 4, line 13; column 9, lines 8-39; and column 6, lines 1-10).

**Claims 2-3 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pinsky, Miyajima, Tian, and Yang as applied to the claims above, and further in view of Cawley (US Patent 5,361,334), hereinafter referred to as Cawley.**

In reference to claim 2, Pinsky, Miyajima, Tian, and Yang show a medical image routing method wherein receiving the network communication comprises: storing the asset while receiving the network communication, (Pinsky column 3, line 67 to column 4, line 7); instantiating a validation software module and a storage manager software module, wherein the validation software module and the storage manager software module receive the asset in parallel, (Pinsky column 12, lines 12-35; Tian column 1, line 52 to column 2, line 40; and Yang column 1, lines 48-63). However, the references do

Art Unit: 2153

not show storing and receiving the asset in a ring buffer. Nonetheless, storing information in a ring buffer was well known in the art at the time of the invention, as further evidenced by Cawley. Therefore this would have been an obvious modification to the aforementioned medical image routing method to one of ordinary skill in the art at the time of the invention.

In an analogous art, Cawley discloses a method for routing network communication (i.e. packets) that employs ring buffers for receiving and storing the data, and subsequently forwarding this data to the intended destination (column 2, line 45 to column 3, line 14). One of ordinary skill in the art would have been motivated to incorporate a ring buffer in the aforementioned method, so as to prevent data collision and gridlock during transmission, thereby increasing network efficiency (Cawley column 2, line 60-65 and column 3, lines 2-6).

In reference to claim 3, Pinsky and Tian show the medical image routing method to further comprise: receiving the network communication with multiple software modules; and storing the asset and validating the patient data with different software modules (Pinsky column 11, lines 31-36 and Tian column 1, line 52 to column 2, line 40).

**Claims 4-6,8, and 13-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pinsky, Miyajima, Tian, and Yang as applied to the claims**

Art Unit: 2153

**above, and further in view of Johnson (US Patent 6,351,547), hereinafter referred to as Johnson.**

In reference to claims 4 and 13, Pinsky, Miyajima, Tian, and Yang fail to explicitly show the medical image method wherein the patient data comprises medical data and image data comprises medical images. Nonetheless, these limitations were well known in the art at the time of the invention, as further evidenced by Johnson. Therefore, this would have been an obvious modification to the aforementioned method.

In an analogous art, Johnson shows a method for formatting medical digital images to conform to communications standards in which image data comprises medical digitized images and patient data comprises medical data (i.e. attribute information), (column 4, lines 24-36 and column 2, lines 9-15). One of ordinary skill in the art would have been motivated to accordingly modify the aforementioned method, so as to increase the speed and reliability of connecting medical imaging devices to remote locations via a network (Johnson column 5, lines 1-6).

In reference to claims 5 and 14, Johnson shows the medical image routing method wherein medical asset data comprises patient information, session information, and study information (Johnson column 4, lines 24-36).

In reference to claims 6 and 15, Tian, shows the medical image routing method wherein validating the patient data comprises syntactically and semantically validating a

Art Unit: 2153

number of DICOM tags within the patient data (Tian column 5, line 65 to column 6, line 5 and Johnson column 4, lines 24-36 and column 2, lines 20-27).

In reference to claim 8, Pinsky, Miyajima, Tian, and Yang do not show the medical image routing method wherein storing the asset comprises buffering the storage asset to a local storage medium. However, this would have been an obvious modification to the aforementioned method to one of ordinary skill in the art at the time of the invention, as further evidenced by Johnson.

In an analogous art, Johnson shows a method for formatting medical digital images to conform to communications standards in which an asset (i.e. image) is buffered (i.e. queued) to a local storage medium (i.e. hard disk), (column 3, lines 14-26). One of ordinary skill in the art would have been motivated to accordingly modify the aforementioned method, so as to increase the speed and reliability of connecting medical imaging devices to remote locations via a network (Johnson column 5, lines 1-6).

**Claim 11 is rejected under 35 U.S.C. 103(a) as being unpatentable over Pinsky, Miyajima, Tian, and Yang as applied to the claims above, further in view of Wahle (Secure Inter-Institutional Image Communication by using DICOM-DICOM Gateways- [retrieved IEEE database]), and further in view of Fendick (US Patent 6,252,857), hereinafter referred to as Wahle and Fendick respectively.**

Art Unit: 2153

In reference to claim 11, Pinsky, Miyajima, Tian, and Yang show substantial features of the claimed invention. However, the references do not show the medical image routing method to further comprise forwarding the network communication to plurality of storage systems. Nonetheless, this would have been an obvious modification to the aforementioned method for one of ordinary skill in the art at the time of the invention, as further evidenced by Wahle.

In an analogous art, Wahle discloses a method for transporting network communications (i.e. medical images and patient related data) to various storage systems (i.e. inter-institutional image archiving networks) via DICOM gateways (Abstract and Introduction). One of ordinary skill in the art would have been so motivated to incorporate this modification into the aforementioned method so as to provide automated transfers of images between different institutions, thereby increasing the reliability of medical information access to remote locations (Wahle Conclusion). In addition, the references fail to explicitly disclose forwarding the network communications to a plurality of storage systems in parallel. Nonetheless, this modification to the medical image routing method would have been obvious to one of ordinary skill in the art at the time of the invention, as further evidenced by Fendick.

In an analogous art, Fendick discloses a method for simultaneous transmission of information to multiple destinations or “multicasting”, (column 2, lines 50-56 and Figure 2). One of ordinary skill in the art would have been motivated to implement this modification into the aforementioned method in order to support the concurrent transmission of medical data to a plurality of destinations (e.g. hospital areas, off-site

Art Unit: 2153

facilities), thereby increasing system flexibility and ease of use, (Schnellinger column 5, lines 30-48).

**Claim 17 is rejected under 35 U.S.C. 103(a) as being unpatentable over Haworth, Flaig, Miyajima, Tian, and Yang and further in view of Cawley (US Patent 5,361,334), hereinafter referred to as Cawley.**

In reference to claim 17, Haworth, Flaig, Miyajima, Tian, and Yang fail to show a router further comprising computer-readable medium buffering the network communication in a ring buffer, wherein the storage manager software module and validation software module read the network communication from the ring buffer. Nonetheless, storing information in a ring buffer was well known in the art at the time of the invention, as further evidenced by Cawley. Therefore these limitations would have been an obvious modification to the aforementioned medical image routing method to one of ordinary skill in the art at the time of the invention.

In an analogous art, Cawley discloses a method for routing network communication (i.e. packets) that employs computer-readable ring buffers for receiving and storing the data. Subsequently the data is read from the buffer in order to forward this data to the intended destination (column 2, line 45 to column 3, line 14). One of ordinary skill in the art would have been motivated to incorporate a ring buffer in the aforementioned router, so as to prevent data collision and gridlock during transmission, thereby increasing network efficiency (Cawley column 2, line 60-65 and column 3, lines 2-6).

**Claims 18-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Haworth, Flaig, Miyajima, Tian, and Yang and further in view of Johnson (US Patent 6,351,547), hereinafter referred to as Johnson.**

In reference to claim 18, Haworth, Flaig, Miyajima, Tian, and Yang fail to show a router further wherein the patient data comprises medical data and image data comprises medical images. Nonetheless, these limitations were well known in the art at the time of the invention, as further evidenced by Johnson. Therefore, this would have been an obvious modification to the aforementioned router.

In an analogous art, Johnson shows a method for formatting medical digital images to conform to communications standards in which image data comprises medical digitized images and patient data comprises medical data (i.e. attribute information), (column 4, lines 24-36 and column 2, lines 9-15). One of ordinary skill in the art would have been motivated to accordingly modify the aforementioned method, so as to increase the speed and reliability of connecting medical imaging devices to remote locations via a network (Johnson column 5, lines 1-6).

In reference to claim 19, Johnson shows the router wherein medical asset data comprises patient information, session information, and study information (Johnson column 4, lines 24-36).

Art Unit: 2153

In reference to claim 20, Tian, and Johnson show the router wherein validating the patient data comprises syntactically and semantically validating a number of DICOM tags within the patient data (Tian column 5, line 65 to column 6, line 5 and Johnson column 4, lines 24-36 and column 2, lines 20-27).

**Claim 22 is rejected under 35 U.S.C. 103(a) as being unpatentable over Haworth, Flaig, Miyajima, Tian, and Yang further in view of Wahle (Secure Institutional Image Communication by using DICOM-DICOM Gateways- [retrieved IEEE database]), and further in view of Fendick (US Patent 6,252,857), hereinafter referred to as Wahle and Fendick respectively.**

In reference to claim 22, Haworth, Miyajima, Flaig, Tian, and Yang show substantial features of the claimed invention. However, the references do not show the router to further comprise forwarding the network communication to plurality of storage systems. Nonetheless, this would have been an obvious modification to the aforementioned method for one of ordinary skill in the art at the time of the invention, as further evidenced by Wahle.

In an analogous art, Wahle discloses a method for transporting network communications (i.e. medical images and patient related data) to various storage systems (i.e. inter-institutional image archiving networks) via DICOM gateways (Abstract and Introduction). One of ordinary skill in the art would have been so motivated to incorporate this modification into the aforementioned method so as to provide automated transfers of images between different institutions, thereby increasing

Art Unit: 2153

the reliability of medical information access to remote locations (Wahle Conclusion). In addition, the reference fails to explicitly disclose forwarding the network communications to a plurality of storage systems in parallel. Nonetheless, this modification to the router would have been obvious to one of ordinary skill in the art at the time of the invention, as further evidenced by Fendick.

In an analogous art, Fendick discloses a method for simultaneous transmission of information to multiple destinations or "multicasting", (column 2, lines 50-56 and Figure 2). One of ordinary skill in the art would have been motivated to implement this modification into the aforementioned router in order to support the concurrent transmission of medical data to a plurality of destinations (e.g. hospital areas, off-site facilities), thereby increasing system flexibility and ease of use, (Schnellinger column 5, lines 30-48).

**Claim 24 is rejected under 35 U.S.C. 103(a) as being unpatentable over Schnellinger, Fendick, and Miyajima as applied to the claims above, and further in view of Wahle (Secure Inter-Institutional Image Communication by using DICOM-DICOM Gateways- [retrieved IEEE database]), hereinafter referred to as Wahle.**

In reference to claim 24, Schnellinger, Fendick, and Miyajiman show the Autorouter method wherein selecting a plurality of routes comprises selecting routes to a plurality of destinations in parallel, (Schnellinger column 3, lines 10-45 and Fendick column 2, lines 50-56). However, the references do not explicitly show the plurality of destinations as a plurality of archive systems. Nonetheless, this would have been an

Art Unit: 2153

obvious modification to the aforementioned Autorouter method for one of ordinary skill in the art at the time of the invention, as further evidenced by Wahle.

In an analogous art, Wahle discloses a method for transporting network communications (i.e. medical images and patient related data) to various inter-institutional image archiving systems via DICOM gateways (Abstract and Introduction). One of ordinary skill in the art would have been so motivated to incorporate this modification into the aforementioned method so as to provide automated transfers of images between different institutions, thereby increasing the reliability of medical information access to remote locations (Wahle Conclusion).

**Claims 26-28 are rejected under 35 U.S.C. 103(a) as being unpatentable over Schnellinger, Fendick, and Miyajima, as applied to the claims above, and further in view of Cooke, Jr. et al. (US Patent 6,574,629), hereinafter referred to as Cooke.**

In reference to claim 26 and 28, Schnellinger, Fendick, and Miyajima show substantial features of the claimed invention, specifically the Autorouter method wherein: the network comprises a medical imaging network (i.e. PACS) [claim 25], (Schnellinger column 1, line 61 to column 2, line 20 and column 3, line 59 to column 4, line 13); and comparing at least a portion of the medical asset data comprises parsing the medical asset data [claim 28], (Schnellinger column 7, line 62 to column 8, line 3). However, the references fail to show the method wherein: the network communication complies with the DICOM protocol [claims 26 and 28], and further wherein storing

Art Unit: 2153

routing information comprises storing routing information mapping Application Entity Names to routes within the medical imaging network [claim 26]; and to identify a set of DICOM tags and corresponding data [claim 28]; and assessing a routing rule from the set of routing rules based on the DICOM tags and corresponding data, [claim 28]. Nonetheless, these limitations would have been obvious modifications to the aforementioned Autorouting system to one of ordinary skill in the art at the time of the invention, as further evidenced by Cooke.

In an analogous art, Cooke shows a picture archiving and communication method that involves routing network communications complying with the DICOM format according to predetermined routing information (i.e. rules), (column 2, lines 14-44 and column 5, line 65 to column 6, line 25). This predetermined routing information maps Application Entity Names (i.e. modality) to routes within the network, (column 2, lines 45-56). In addition, Cooke shows identifying a set of DICOM tags and corresponding data; and assessing a routing rule from the set of routing rules based on the DICOM tags and corresponding data, (column 9, line 65 to column 10, line 50 and column 17, line 60 to column 18, line 50). One of ordinary skill in the art would have been so motivated to implement this modification to the aforementioned Autorouting method in order to "enhance the overall efficiency of the system, and which makes the system more user-friendly", (Cooke column 2, lines 5-10).

In reference to claim 27, Schnellinger and Cooke show the Autorouting method wherein selecting a plurality of routes from the routing information comprises comparing

Art Unit: 2153

an Application Entity Name to routes within the medical network, (Schnellinger column 3, lines 20-45; column 4, lines 59-63; and Cooke column 15, line 55 to column 16, line 65).

**Claims 29-30 are rejected under 35 U.S.C. 103(a) as being unpatentable over Schnellinger, Fendick, and Miyajima as applied to the claims above, and further in view of Martin et al. (US Patent 6,532,455), hereinafter referred to as Martin**

In reference to claim 29, Schnellinger, Fendick, and Miyajima show the Autorouting method wherein storing a set of rules conform to a user-defined grammar (i.e. Multiple Autorouter Rule) for routing the medical asset data, (Schnellinger column 4, lines 6-39). However the references fail to show XML-based set of rules. Nonetheless, this would have been an obvious modification to the aforementioned Autorouter method to one of ordinary skill in the art at the time of the invention, as further evidenced by Martin.

Martin shows a method for content-based document routing that employs a rule engine defined in XML format, (column 1, lines 35-57 and column 2, lines 30-36). One of ordinary skill in the art would have been so motivated to implement this modification into the Autorouting method so as to implement user-defined routing mechanisms, thereby increasing the system efficiency and ease of use (Martin column 2, lines 15-23).

Art Unit: 2153

In reference to claim 30, Schnellinger shows the Autorouter method to further comprise presenting an interface for receiving user input that defines the user-defined grammar, (Schnellinger column 4, lines 34-39).

### ***Conclusion***

**THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a). A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.
